Oslo, Norway

# Decision making SAVR vs TAVI

# Bioprosthetic Valve Dysfunction

## Structural Valve Deterioration

Intrinsic permanent changes of the prosthetic valve (i.e., calcification, leaflet fibrosis, tear or flail) leading to degeneration and/or haemodynamic dysfunction

## Nonstructural Valve Deterioration

Any abnormality not intrinsic to the prosthetic valve itself (i.e., intra- or para-prosthetic regurgitation, prosthesis malposition, patient-prosthesis mismatch, late embolization) leading to degeneration and/or dysfunction

## Thrombosis

Thrombus development on any structure of the prosthetic valve, leading to dysfunction with or without thrombo-embolism

## Endocarditis

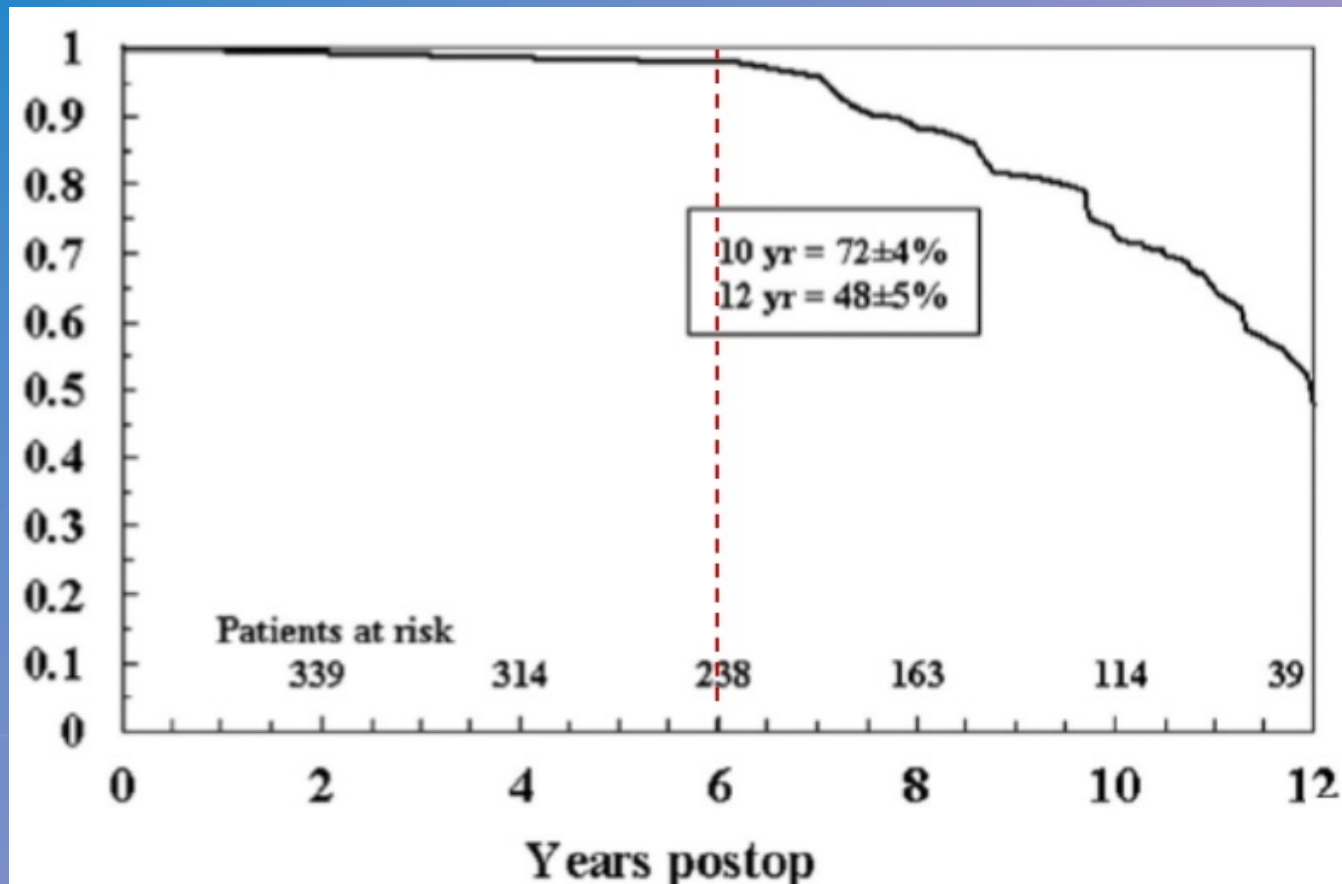

Infection involving any structure of the prosthetic valve, leading to perivalvular abscess, dehiscence, pseudo-aneurysms, fistulae, vegetations, cusp rupture or perforation

# Durability: Toronto stent-less valve

Freedom from structural deterioration

David et al. JTSC. 2008; 135:19-24

# Low risk patients # Younger patients

# Low risk and young patient

## Low risk patient

- Male 83 years
- 180 cm, 75 kg
- Hypertension
- SR
- AS (tricuspid valve)
- No other co-morbidities

## Young patient

- Female, 60 years
- 165 cm, 80 kg
- Previous CABG
- Peripheral vessel disease
- Renal failure

# Review of the Partner trials

- High risk
- Intermediate risk
- Low risk

Markham et Sharma, Intervent  
Cardiol Clin 9 (2020)461-467

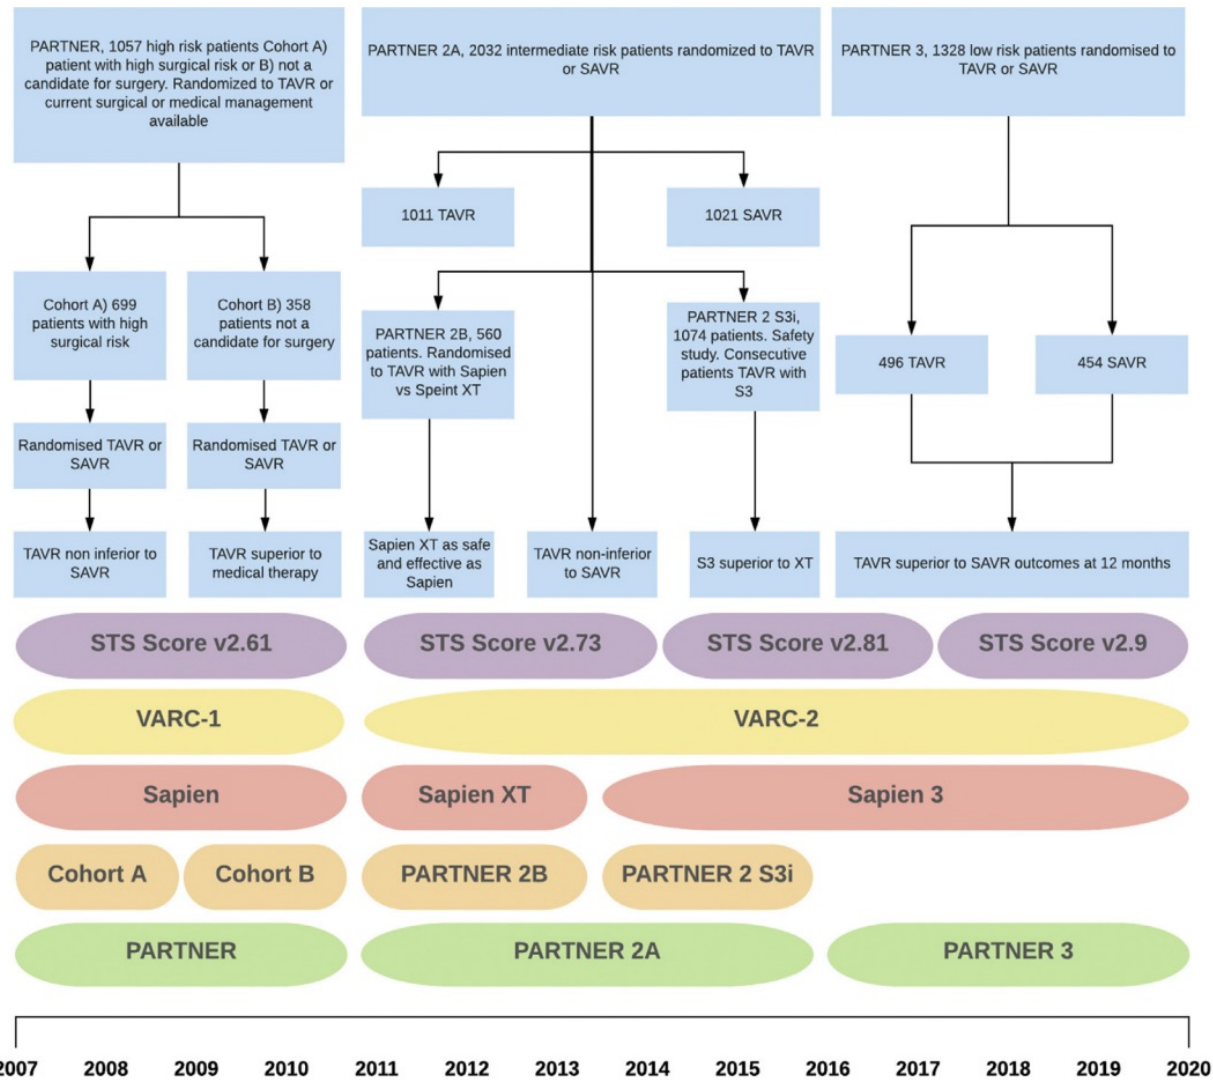

Fig. 1. PARTNER trial design, valve type, patient characteristics, and scoring systems.

# High risk trials

- These are no longer an issue, these have been done
- The old and high risk patients become TAVI, even though an old patient can be low risk
- The question for high risk patients are now, who should **not** have TAVI
- For low risk patients it is should all have TAVI?

Do we already have long-term durability data on TAVI?

No, but we should expect some comprehensive data

Intermediate risk: PARTNER 2

Wheeler, M.C. Alu, C.R. Smith, and M.B. Leon, for the PARTNER 2 Investigators\*

**Figure 1. Time-to-Event Curves for Death from Any Cause or Disabling Stroke to 5 Years.**

Shown is the incidence of death from any cause or disabling stroke among patients assigned to transcatheter aortic-valve replacement (TAVR) and those assigned to surgical aortic-valve replacement. Values for incidence were calculated with the use of Kaplan-Meier methods and were compared with the use of the log-rank test. The number of patients at risk at 60 months includes patients with early visits ahead of the follow-up window.

**No. of Patients with Echo Findings and Patients Alive**

Procedure	Echo findings	Alive
TAVR	872	609
Surgery	757	516
TAVR	945	800
Surgery	896	727

PVL @ 2years : severe 8.5% vs 0.4% TAVI vs SAVR  
 mild 25.2% vs 3.5%  
 Concomittant CABG/PCI 14.5% vs 3.9%,  
 Valve SAVR vs TAVI 23.6% vs 3.9%  
 Gradient almost equal  
 Valve related rehospitalization x3 for TAVI

## Increasing Number of TAVR Procedures in Younger Lower Risk Patients

- Trends in transcatheter and surgical aortic valve replacement (TAVR and SAVR) in the U.S. show yearly increases in the overall number of TAVR procedures and significant growth in TAVR utilization among younger adults with aortic stenosis.<sup>1,2</sup>

Commercial TAVR procedures in the U.S.

TAVR and SAVR procedures by age group in the U.S.

# Studies for low risk

Fig. 1 | Evolution of TAVI indications. Over time, the indications for transcatheter aortic valve implantation (TAVI) have expanded to include patients at a lower operative risk (that is, a lower Society of Thoracic Surgeons (STS) score) and with less frailty. Several ongoing studies are exploring the indications for TAVI in asymptomatic severe aortic stenosis (AS), moderate AS with heart failure (HF), and severe aortic regurgitation (AR). The graph shows the STS and frailty score and the surgical risk classification of the patient cohort in each study plotted according to the year of study publication<sup>86,87</sup>.

Fig. 2 | Studies on TAVI versus SAVR in patients at different surgical risk and of similar age. As shown in the graph, the decrease in the surgical risk of death, as assessed by the Society of Thoracic Surgeons (STS) risk score, in the successive trials on transcatheter aortic valve implantation (TAVI) versus surgical aortic valve replacement (SAVR) is driven by fewer comorbidities in the study cohort rather than by younger age.

#### 4-Year Outcomes of Patients With Aortic Stenosis in the Evolut Low Risk Trial

include safety events and ... as determined by echocardiography. ... cases were reported as Kaplan-Meier ... a number of patients with an evolut ... compared by log-rank test. Evolut ... outcomes were based on echocardiographic laboratory assessment. The study was approved by the Institutional Review Boards at each site, and all patients provided informed consent.

...ents (730 TAVR, 684 SAVR) ... mitted implantation. Four-year ... able for 94.7% of TAVR patients ... withdrew, 7 were lost to follow-up, 1 ... 4 89.2% of SAVR patients (610/684). 60 ... were lost to follow-up). At baseline, ... had a mean age of 74 years in both ... treatment arms and mean Society of Thoracic Surgeons Predicted Risk of Mortality scores of 2.0 in the TAVR group and 1.9 in the SAVR group. There were no significant baseline differences between groups.

The primary endpoint of all-cause mortality or disabling stroke at 4 years was 10.7% (76) in the TAVR group and 14.1% (90) in the SAVR group (HR, 0.74; 95% CI, 0.54-1.00;  $P = 0.05$ ), representing a 26% relative reduction in the hazard for death or disabling stroke with TAVR compared with SAVR. The absolute difference between treatment arms for the primary endpoint continued to increase over time: -1.8% at 1 year, -2.0% at 2 years, -2.9% at 3 years, and -3.4% at 4 years (Figure 1). Rates of the primary endpoint components were 9.0% (64) vs 12.1% (76) ( $P = 0.07$ ) for all-cause mortality and 2.9% (20) vs 3.8% (24) ( $P = 0.32$ ) for disabling stroke with TAVR vs SAVR, respectively. The composite of all-cause mortality, disabling stroke, or aortic valve rehospitalization was significantly lower with TAVR compared with SAVR (10.0% [128] vs 12.4% [144]); HR, 0.78; 95% CI 0.61-0.98;  $P = 0.04$ ). Aortic valve rehospitalization was 10.3% (71) with TAVR vs 12.1% (75) with SAVR ( $P = 0.27$ ). New permanent pacemaker implantation was significantly higher in the TAVR group (24.6% [171] vs 9.9% [62];  $P < 0.0001$ ). Indicators of valve performance including aortic valve reintervention (1.3% [9] TAVR vs 1.7% [10] SAVR;  $P = 0.63$ ), clinical or subclinical valve thrombosis (0.7% [5] TAVR vs 0.6% [4] SAVR;  $P = 0.84$ ), and valve endocarditis (0.9% [6]

**What is the clinical question being addressed?**  
What are the 4-year outcomes of patients randomized to TAVR vs SAVR in the Evolut Low Risk Trial?

**What is the main finding?**  
There was a 26% reduction ( $P = 0.05$ ) in all-cause mortality or disabling stroke with TAVR vs SAVR, and the difference expanded over time.

[MEMBERSHIP >](#)

## Joint Statement from STS and EACTS regarding Aortic Valve Replacement in Low-Risk Patients

In collaboration with the Society of Thoracic Surgeons, EACTS has published a joint statement in response to new TAVI/SAVR research on low-risk patients.

### Statement

The [Society of Thoracic Surgeons \(STS\)](#) and the [European Association for Cardio-Thoracic Surgery \(EACTS\)](#) embrace Transcatheter Aortic Valve Implantation (TAVI) and Surgical Aortic Valve Replacement (SAVR) as outstanding therapeutic options for patients with aortic stenosis. TAVI has proven to be an excellent innovation, particularly for patients of advanced age or risk, that all surgeons and cardiologists unequivocally support through proper functioning multi-disciplinary heart teams.

# All-cause Death

*Number at risk:*

TAVR	496	490	478	460	438	405
Surgery	454	427	409	394	379	346

# Clinical Implications

The 5-year follow-up findings from the PARTNER 3 trial reaffirm the clinical and echocardiographic benefits of SAPIEN 3 TAVR as a meaningful alternative to surgical therapy for low-risk severe, symptomatic AS patients!

# EVOLUT LOW RISK TRIAL | 4 YEAR RESULTS

## OBJECTIVE

- To evaluate 4-year clinical and hemodynamic outcomes with TAVR vs SAVR in patients from the Evolut Low Risk trial

# EVOLUT LOW RISK TRIAL

**4-Year Outcomes of Patients With Aortic Stenosis in the Evolut Low Risk Trial**

include safety events and as determined by echocardiography. Outcomes were reported as Kaplan-Meier estimates, compared by log-rank test. Endpoints were based on echocardiographic assessment. The study was approved by the Institutional Review Boards at each site, and all patients gave informed consent.

A recent 3-year analysis of the Medtronic Evolut Transcatheter Aortic Valve Replacement in Low Risk Patients trial (NCT02702883) demonstrated sustained valve performance and durable benefits compared with surgical aortic valve replacement (SAVR) in low-risk patients. Close follow-up of the low-risk patients is warranted given the limited long-term data currently available. In this study, we report the 4-year outcomes of the Evolut Low Risk trial.

The Evolut Low Risk study design has been described. Patients underwent aortic valve replacement with the Evolut transcatheter aortic valve (Edwards Lifesciences) or a surgical bioprosthesis (St. Jude Medical) from May 2019 and are being followed. The primary endpoint of the Evolut Low Risk trial is the composite of all-cause mortality or disabling stroke through 2 years, with annual reporting of this outcome prespecified in the study protocol. Additional endpoints in this 4-year analysis

**Published Today in JACC**

**What is the clinical question being addressed?**  
What are the 4-year outcomes of patients randomized to TAVR vs SAVR in the Evolut Low Risk Trial?

**What is the main finding?**  
There was a 26% reduction ( $P = 0.05$ ) in all-cause mortality or disabling stroke with TAVR vs SAVR, and the difference expanded over time.

### Primary Endpoint: All-Cause Mortality or Disabling Stroke

How can they be so different?

## Low risk trials at TCT 2023

PARTNER 3 and Evolut Low Risk trials presented

Highly selected cohorts in industry sponsored trials

PARTNER 3 : non-inferiority of TAVI, published in NEJ

Evolut Low Risk Trial : Superiority of TAVI, published as a Research letter in JACC

The two trials are not comparable, anatomical screening exclusion higher in PARTNER, hence mortality 14.1% vs 8.2 % in Evolut vs PARTNER trial for SAVR

In addition concomitant procedures in 26% of procedures in SAVR group in both trials

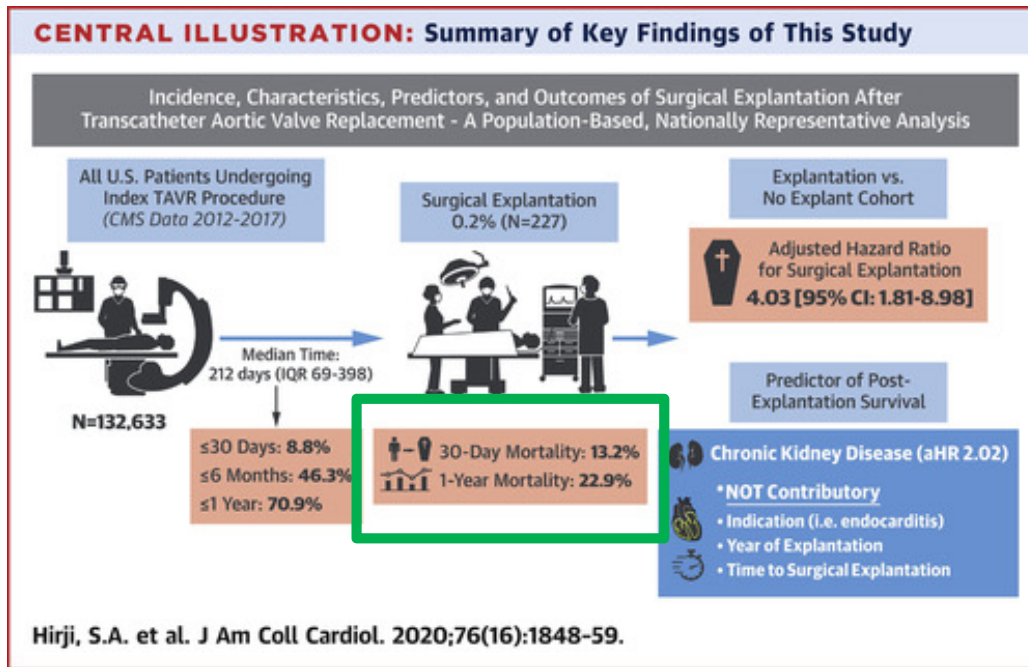

# Real world analysis in STS Database: isolated AVR

- 92.9% survival @ 5 years, TAVI in Partner Trial 90%
- 90.0% survival @ 8 years
- Better survival of patients < 75 years and STS-PROM < 1%
- 42000 patients, 19000 at risk at 5 years
- 26% of surgical patients in the two low risk trials underwent concomittant procedures (CABG, MV surg, ablation), patients with ischemic disease are different than those with isolated arotic valve disease, results are accordingly

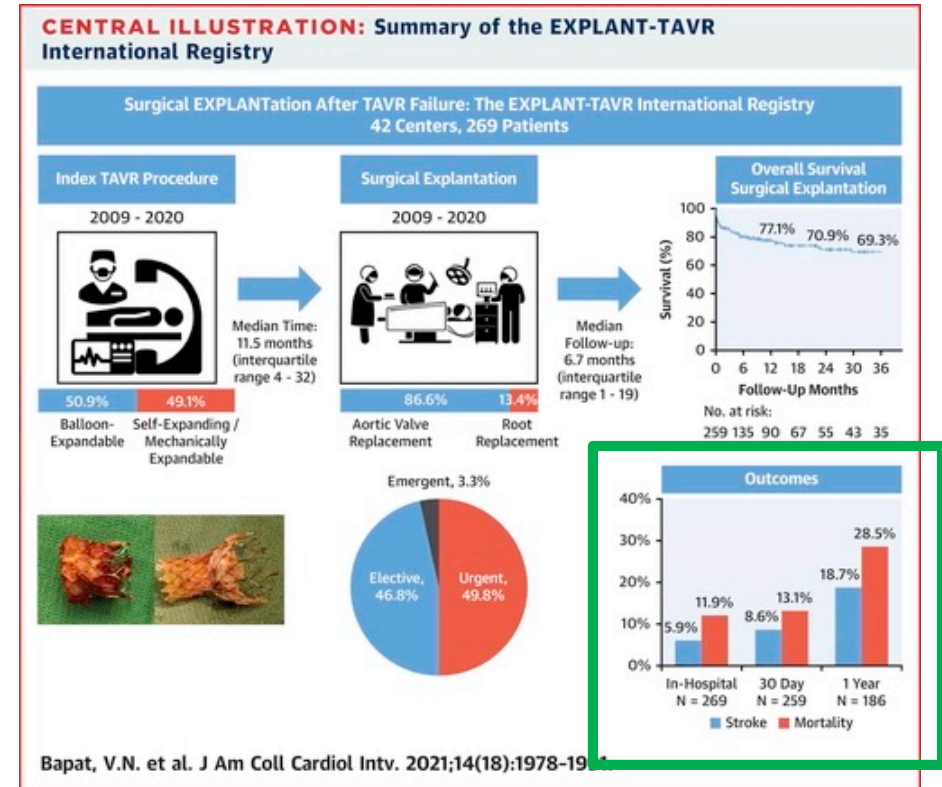

# SURGICAL EXPLANT DATA

## Associated with high 30-day operative mortality 10-13%

Hirji et al. J Am Coll Cardiol. 2020 Oct, 76 (16) 1848–1859

Bapat et al. J Am Coll Cardiol Intv. 2021;14(18):1978-1991

# Summary

- It is now >20 years since first TAVI
- First there were trials for high risk patients, now trials are in low risk patients
- Though, the patients were quite old in all the low risk studies
- For now we should focus more on the age of the patient for lifetime management and risk
- Still we need long term follow up, especially regarding durability
