OUTCOMES AND PREDICTORS OF IN-HOSPITAL MORTALITY IN INFECTIVE ENDOCARDITIS PATIENTS REQUIRING SURGERY

PRESENTER: NURUL HAFIZAH ZAILANI

Nurul Hafizah Z¹, Nur Aziah I¹, Fatahiyah AB¹, David YTW², Maizatu Akma S³, Mohamed Ezani MT¹, Alwi Y¹

(1) Cardiothoracic Surgery Department, National Heart Institute, Malaysia

(2) Cardiology Department, National Heart Institute, Malaysia

(3) Clinical Research Department, National Heart Institute, Malaysia

INTRODUCTION

- Despite the advances in technology and surgery, Infective endocarditis (IE) remains a disease with significant mortality and morbidity
 - 15-30% in-hospital mortality
- Proportion of IE cases undergoing valve surgery increased 7% per decade between 1970 to 2000
- Surgery gives a **survival advantage of up to 20% in the first year**
- 3 main indications of surgery :
 - Heart failure
 - Uncontrolled infection
 - Embolism prevention

OBJECTIVES

01 General Objective

1. To evaluate the clinical outcomes of IE in adult patients requiring surgery
2. To determine the significant predictors associated with in-hospital mortality.

02 Specific Objectives

1. To determine the association of the demographic, echocardiographic, microbiological findings, surgical procedure, pre-and-post operative complications, reasons for not proceed surgery with hospitalization outcomes.
2. To identify predictors for all-cause in-hospital mortality during admissions of new, relapse or recurrent cases.
3. To determine long term all-cause mortality

STUDY POINTS / OUTCOMES

01 Primary Endpoint

- All-cause in-hospital mortality

02 Secondary Endpoints

- Pre-and-post-operative complications.
- Long term all-cause mortality

STUDY METHOD

- A single centre, retrospective observational study
- Period between January 2018 – December 2022
- Cardiac tertiary center of National Heart Institute, Kuala Lumpur, Malaysia
- Patients registered under local Infective Endocarditis (IE) Registry
- Maximum follow up duration: 60 months

STUDY CRITERIA

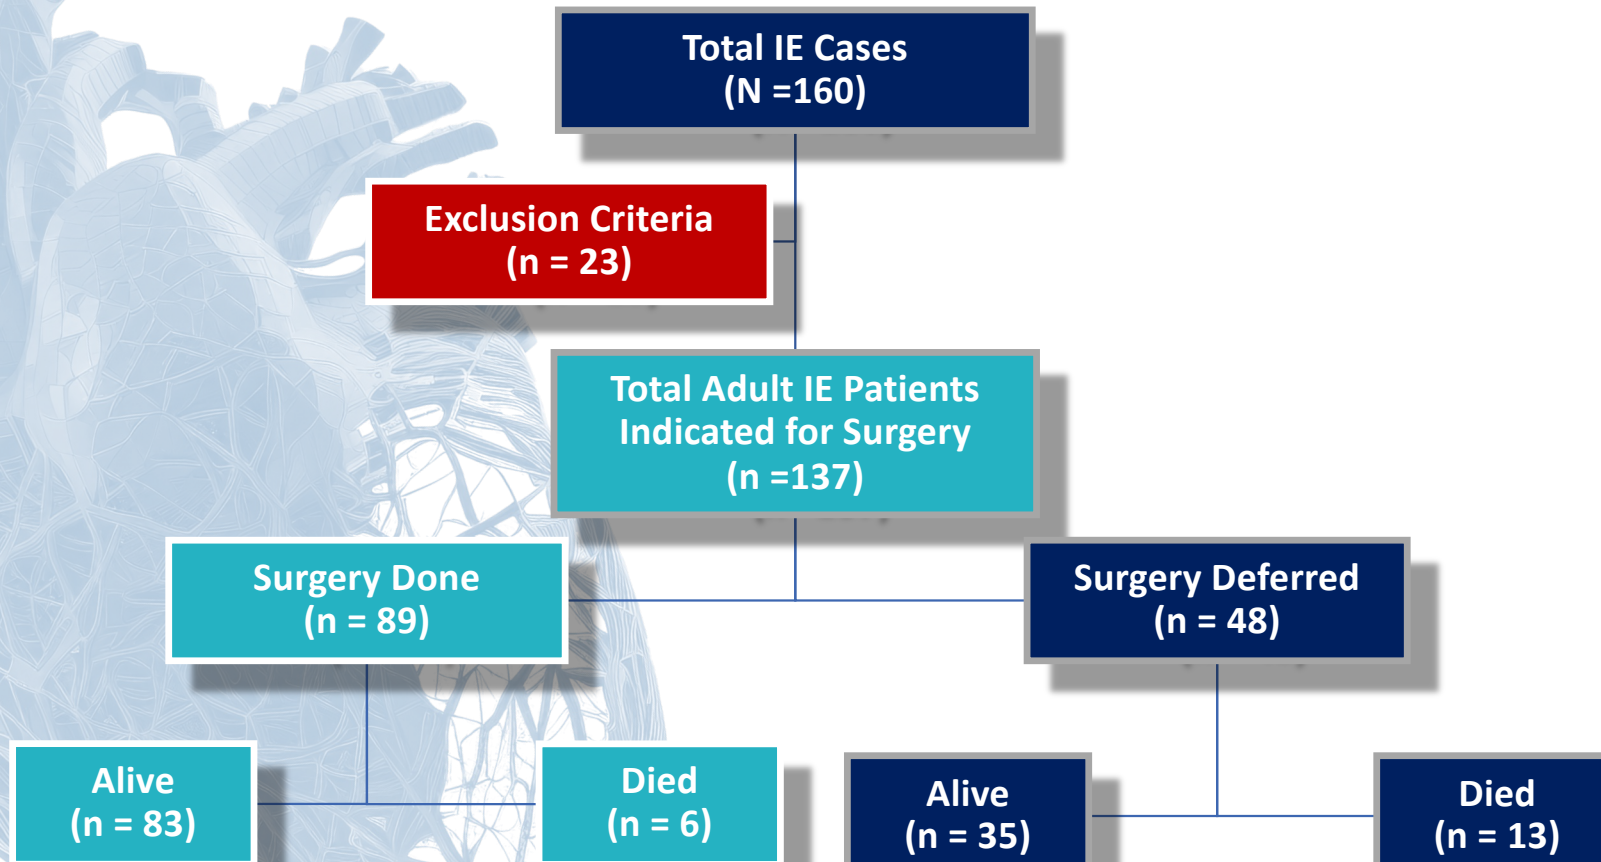

01 Inclusion Criteria

- (1) Acute, recurrent and relapsed IE
- (2) IE with least one valve infected or mixed with cardiac implantable electronic devices or congenital heart disease related infection.
- (3) IE referred for valvular surgery within the readmission.

02 Exclusion Criteria

- (1) Patients age below 18 (Paediatric cases)
- (2) IE, treated as outpatient visit (resolved IE)
- (3) Cardiac implantable electronic devices or congenital heart disease related infection only.

Others	11 (12.4)	10 (12.0)	1 (16.7)	0.558

PREDICTORS OF IN-HOSPITAL MORTALITY

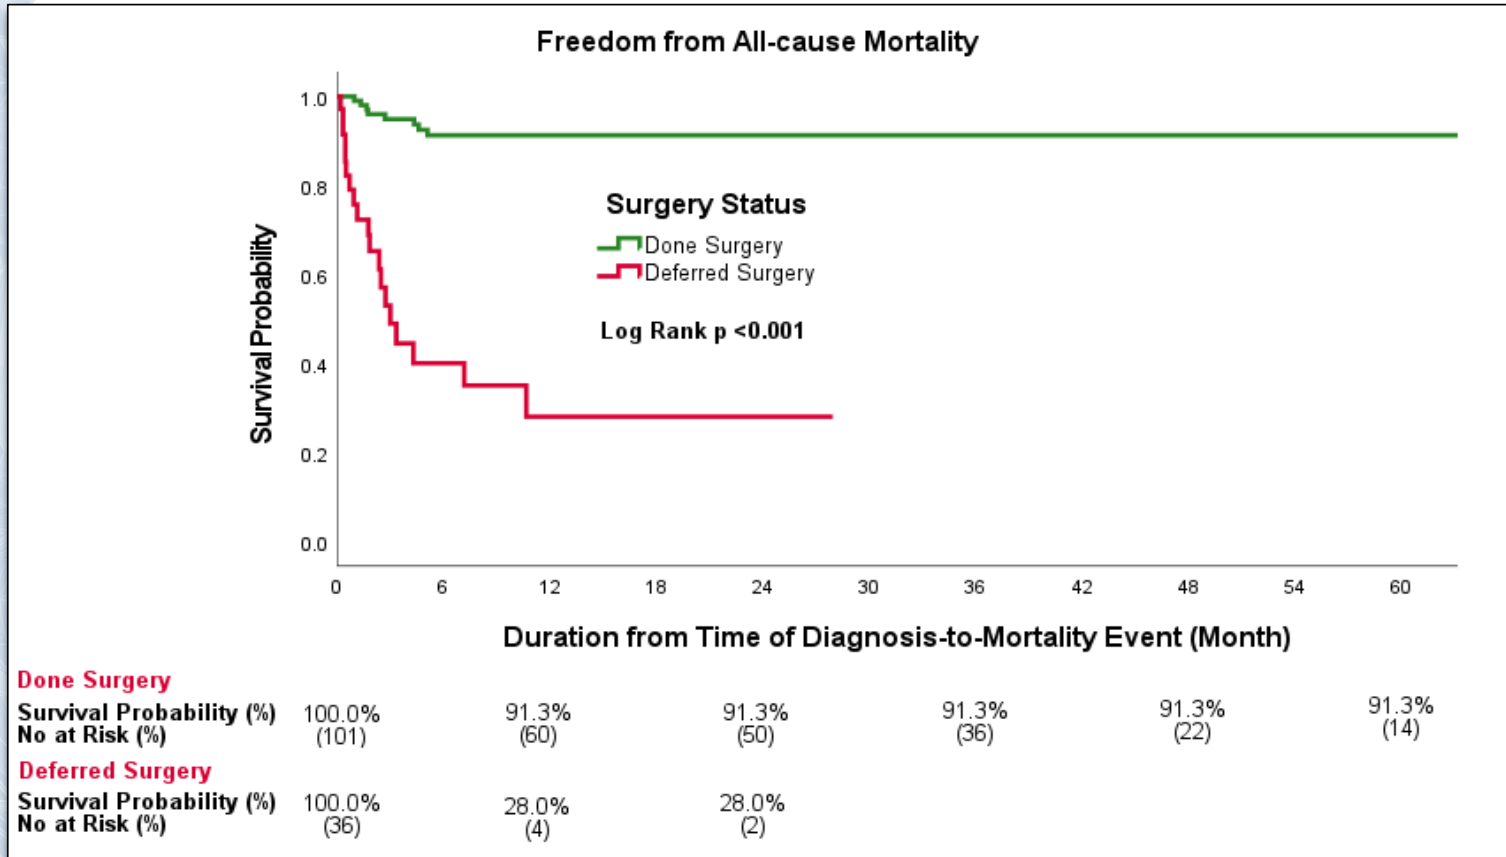

Variables	Univariate Log Regression			
	Unadjusted OR	Lower	Upper	p-value
Age	1.052	1.015	1.090	0.006
NYHA III-IV	3.430	1.166	10.090	0.025
History of prosthetic valve implant	3.474	1.052	11.476	0.041
Prosthetic valve infection	3.474	1.052	11.476	0.041
Absence of pre-op IE Complication	0.295	0.105	0.831	0.021
IE with Cardiogenic shock	26.769	4.891	146.515	<0.001
IE with Congestive heart failure	3.564	1.272	9.981	0.016
IE New conduction abnormality	10.875	1.686	70.137	0.011
Surgical candidate with uncontrolled heart failure	3.241	1.124	9.41	0.029
Deferred surgery	5.138	1.807	14.608	0.002

INDEPENDENT PREDICTORS OF IN-HOSPITAL MORTALITY

Predictors of In-hospital Mortality among Adult Patients with Infective Endocarditis Indicated for Surgery

SURVIVAL ANALYSIS

INSTITUT JANTUNG NEGARA
National Heart Institute

DISCUSSION

- Overall in-hospital mortality is 13.9%
 - Guiomar et al 13.1%, Moreira et al 15% and Farag et al 18.3%
- PVE in-hospital mortality is **31.3%** (5/16) vs **11.5%** (14/121)
 - ESC IE guideline quoted 20-40% in-hospital PVE mortality
- 3 independent predictors of mortality identified :
 - Cardiogenic shock
 - Previous valvular implantation
 - Advanced age
- Other predictors of mortality includes : NYHA III-IV, Absence of pre-op IE complication, congestive heart failure and deferred surgery
- Most of the predictors consistent with other predictors as per ESC guideline

DISCUSSION

- Surgery is a protective factor against mortality
- Surgery was associated with significant reduction in in-hospital mortality (6.7% vs 31.3%, $p < 0.001$) as compared to :
 - Moreira et al (15.5% vs 32.6%, $p = 0.028$)
 - Lalani et al (12.1% vs 20.7%, $p < 0.001$)
- Excellent post-operative survival for IE in our cohort is 91.3% over 5 years as opposed to Farag et al (63.3% post op survival over 5 years)

LIMITATIONS

- Small, granular data
- Single cardiac center
- Retrospective, observational study – Prone to Survival Bias
- Referral from other centre – Difficult to assess the timing of surgery
- Only up to 5 years follow up – Longer duration of follow up allows us to look into long term mortality

CONCLUSIONS

- Surgical intervention reduces mortality
- Independent predictors of in-hospital mortality for IE were **cardiogenic shock, previous valvular implantation** and **age**
- Predictors of all-cause in-hospital mortality also includes **preoperative heart failure, new conduction** abnormality and **deferred surgery**.
- **Significantly higher PVE mortality** emphasize the importance of prevention and prompt treatment of PVE.
- Early identification of patients with strong predictors of mortality may be helpful in improving outcome.

THANK YOU

APPENDIX: STATISTICAL ANALYSIS

01 Descriptive Analysis

- Continuous variables : mean with standard deviations / median with interquartile range (IQR)
- Categorical variables : percentages

02 Comparative Analysis

- Continuous variables : independent t-test or Mann Whitney test
- Categorical variables : chi-square test or Fisher's exact test

03 Predictive Analysis

Logistic regression :

- Univariate analysis ($p < 0.05$) were included in the multivariate analysis with a forward Likelihood Ratio (LR) stepwise approach.
- Results :
 - unadjusted odds ratios (un-aOR)
 - adjusted odds ratios (aOR) with 95% (95% CIs).

04 Survival Analysis

- Kaplan-Meier method
